ENGINEERING ASSESSMENT PORTFOLIO | CYNBIT

Revio InsightOps AI

AI Opportunity & Business Value Report

"Turn customer reviews into evidence-backed actions."

A Strategic and Operational Evaluation of Customer Feedback Intelligence for Enterprise Decision Support

Prepared By:	Bhishant Sharma
Role / Assessment:	Cynbit AI/ML Engineer Intern Assessment
Submission Date:	October 2026
Evaluation Target:	Cynbit Technical & Hiring Review Team
Live Streamlit Demo:	Open Live Application (Streamlit Cloud)
GitHub Repository:	View Source Code (github.com/Bhishant)

1. Project Information & Live Application Access

Revio InsightOps AI is an operational machine learning and decision-support prototype engineered to transform unstructured customer reviews into categorized, prioritized, and evidence-backed operational intelligence. This project was developed by Bhishant Sharma as part of the technical assessment portfolio for Cynbit. The complete system is publicly deployed and accessible for live interactive evaluation, accompanied by open-source code and benchmark datasets.

Project Attribute	Specification / Verified Endpoint	Operational Notes
Project Name	Revio InsightOps AI	Core assessment submission
System Tagline	Turn customer reviews into evidence-backed actions	Product positioning & operational focus
Developer	Bhishant Sharma	Candidate for Cynbit AI/ML Engineer Intern
Evaluation Context	Cynbit Technical & Hiring Review	Practical assessment of AI engineering capability
Public Live Application	https://revio-insightops-ai.streamlit.app/	Clickable link; deployed on Streamlit Cloud
Source Code Repository	https://github.com/Bhishant/revio-insightops-ai	Public GitHub repository with full source history
Primary Benchmark Dataset	Yelp Restaurant Reviews Sentiment Dataset	14,350 usable curated records (Zenodo 18723813)
Current Deployment State	Interactive Prototype / Assessment MVP	In-memory processing; zero external API leakage

Live Interactive Application Endpoint: https://revio-insightops-ai.streamlit.app/

> **[LIVE EVALUATION READY]** The live Streamlit application is running and accessible online. Reviewers can test the system either by uploading arbitrary customer feedback CSV files or by toggling the built-in sample review dataset directly from the sidebar. All predictions, issue categories, and priority heuristics run in real time.

2. Executive Summary

Modern consumer-facing and B2B enterprises gather thousands of customer reviews and feedback submissions across public review platforms, helpdesk tickets, app stores, and post-transaction surveys. While this unstructured text contains vital operational indicators regarding delivery friction, billing errors, product defects, and customer support bottlenecks, organizations frequently suffer from analysis paralysis. Customer support leads, product managers, and operations teams cannot realistically read

every submitted comment. As feedback volume scales, severe complaints become buried beneath routine feedback, escalation response times lengthen, and systemic product or service flaws remain unaddressed.

Revio InsightOps AI solves this bottleneck by providing a structured, transparent, and auditable feedback intelligence workflow. Rather than relying on uncalibrated black-box models or generic generative AI, Revio InsightOps AI employs a pragmatic, production-viable dual-engine architecture: a supervised Machine Learning pipeline (TF-IDF vectorization paired with Logistic Regression) to classify sentiment polarity, coupled with transparent, rule-based deterministic heuristic engines to categorize specific issue themes and calculate actionable operational priority scores bounded between 1 and 55.

Crucially, the application is engineered as a decision-support copilot rather than an autonomous decision-maker. It provides immediate executive-level summary metrics, evidence-grounded investigation directions, and direct access to original review text for full human auditability. In benchmark testing on an uploaded Yelp customer feedback dataset containing 14,351 records, the system successfully surfaced 2,799 negative reviews (19.5% of total volume) and isolated 76 high-priority operational flags requiring immediate triage. On a held-out test split of 2,870 records, the sentiment pipeline achieved 81.85% overall accuracy and a macro F1-score of 0.6951, demonstrating balanced performance across positive (0.906 F1) and negative (0.785 F1) sentiment while identifying clear, transparent boundaries for ongoing improvement in neutral sentiment detection.

3. Introduction

Customer feedback is the primary pulse of product quality and operational efficiency. In today's digital commerce and service environments, customer retention and brand equity hinge upon an organization's ability to swiftly identify customer dissatisfaction, diagnose the underlying root causes, and execute corrective remediation. However, the sheer velocity and volume of incoming textual feedback create an acute operational asymmetry: customers provide rich, qualitative narratives about their experiences, but internal stakeholders lack the bandwidth to manually ingest and synthesize these narratives into prioritized tasks.

Revio InsightOps AI bridges the divide between raw qualitative feedback and rigorous operational execution. By structuring textual comments into standardized dimensions—Sentiment Polarity, Issue Domain, and Priority Urgency—the system empowers operations analysts, customer success managers, and executive leadership to transition from reactive dispute firefighting to proactive, evidence-based operational management.

4. The Business Problem

Organizations that collect customer feedback at scale encounter four fundamental operational failure modes:

- **Cognitive Overload and Labor Cost:** When feedback spans thousands or tens of thousands of monthly reviews, manual reading requires hundreds of analyst hours, leading to significant delays between customer submission and internal awareness.
- **Buried High-Risk Escalations:** Critical complaints detailing severe operational failures—such as double billing, fraudulent charges, unfulfilled orders, or health and safety risks—are often dispersed among thousands of routine or positive comments, preventing prompt escalation.

- **Subjective and Inconsistent Triage:** Different analysts apply subjective criteria when evaluating customer frustration. A complaint flagged as urgent by one representative may be categorized as routine by another, resulting in inconsistent follow-ups and lack of accountability.
- **The Micro-Macro Disconnect:** While traditional business intelligence (BI) dashboards display high-level star ratings or aggregate NPS trends, they fail to connect macro trends with the micro qualitative context necessary to pinpoint exact operational bottlenecks.

5. Why Customer Feedback Analysis Matters

Transforming customer feedback into structured, evidence-backed intelligence delivers measurable business value across four distinct domains:

Strategic Value Pillar	Operational Reality Without AI	Revio InsightOps AI Impact
Customer Churn Mitigation	Unhappy customers churn quietly or publish damaging public reviews before customer support becomes aware.	Heuristic priority scoring instantly flags severe dissatisfaction, enabling targeted interventions before customer churn solidifies.
Root-Cause Defect Isolation	Engineering and operations teams struggle to determine whether complaints stem from product quality, logistics, or digital platforms.	Automated issue categorization groups reviews into 5 concrete operational domains, isolating systemic defects for targeted remediation.
Support Resource Optimization	Support agents manually sift through benign positive reviews to locate urgent tickets, squandering valuable high-touch capacity.	Analysts filter directly for negative, high-priority feedback, focusing human capacity strictly where customer intervention is essential.
Brand Equity & Risk Governance	Public negative reviews compound on external aggregators, permanently depressing conversion rates and prospective client trust.	Rapid triage shortens public response cycles, signaling active operational accountability to customers and marketplace stakeholders.

6. Proposed Solution: Revio InsightOps AI

Revio InsightOps AI introduces a unified decision-support platform that transforms unstructured customer review CSV datasets into clear operational priorities. The system architecture is guided by three engineering principles:

- **1. Pragmatism and Determinism:** The machine learning pipeline utilizes TF-IDF n-gram vectorization and Logistic Regression, ensuring predictable, reproducible classifications without opaque neural network behaviors or external API dependencies.
- **2. Transparent Rule-Based Logic:** Issue categorization and priority scoring are governed by transparent, human-auditable rules and explicit urgency dictionaries, eliminating hallucinations and ensuring explainability.

- **3. Human-in-the-Loop Decision Support:** The application is strictly designed to augment human judgment. It recommends investigation directions and provides editable response templates, but does not execute autonomous, unreviewed customer communications.

7. How the Application Works

The end-to-end user workflow in Revio InsightOps AI follows a seamless six-stage operational progression, guiding the user from raw CSV ingestion to evidence-grounded action.

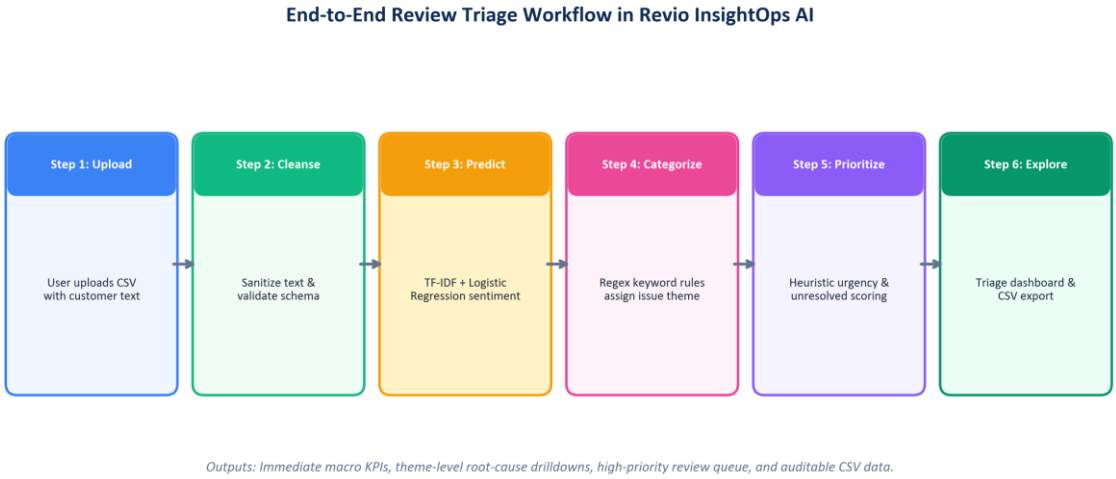

Figure 1: End-to-end review ingestion, machine learning inference, and operational triage workflow.

Detailed operational walkthrough of each workflow stage:

- **Stage 1 — Data Ingestion & Schema Check:** The user uploads a standard CSV file through the Streamlit sidebar. The system validates the presence of the mandatory 'text' column while supporting optional contextual metadata including 'rating', 'branch', and 'date'. A pre-loaded sample dataset is available for instant demonstration.
- **Stage 2 — Input Sanitization:** Missing values are removed, textual whitespace is normalized, and empty rows are filtered to guarantee clean data input for downstream vectorization.
- **Stage 3 — Supervised Sentiment Prediction:** Cleaned review text is passed to the trained scikit-learn pipeline, which generates TF-IDF features across unigrams and bigrams, outputs predicted sentiment (Positive, Neutral, Negative), and records inference confidence probabilities.
- **Stage 4 — Issue Categorization Engine:** Regex word-boundary matching scans the normalized text against curated phrase dictionaries spanning five core themes: Delivery, Product Quality, Customer Support, Billing & Payment, and App & Website (with unmatched reviews assigned to 'Other').
- **Stage 5 — Transparent Priority Scoring:** The system combines predicted sentiment polarity with detected urgency and unresolved grievance keywords to generate a bounded priority score (1 to 55). Reviews scoring 40 or above are flagged as high-priority escalations.
- **Stage 6 — Executive Dashboard & Data Export:** Stakeholders interact with four integrated Streamlit modules to inspect macro KPIs, explore thematic drilldowns, review supporting customer quotes, and export enriched CSV datasets for enterprise operations.

8. Core Features and Capabilities

Revio InsightOps AI organizes feedback intelligence across four dedicated operational modules within the Streamlit interface:

A. Overview Dashboard

The Overview tab serves as the executive summary viewport, presenting macro KPIs and aggregated sentiment and thematic distributions:

- **High-Level KPI Cards:** Four prominent KPI cards present total reviews analyzed, total negative reviews with percentage of volume, high-priority flags (score >= 40), and low-confidence predictions (confidence < 0.55).
- **Sentiment Distribution Donut:** An interactive Plotly donut chart visualizes the proportional distribution of Positive (#34D399), Neutral (#FBBF24), and Negative (#FB7185) sentiment across the uploaded dataset.
- **Common Feedback Themes:** A horizontal bar chart ranks the prevalence of detected operational issue themes, giving managers immediate insight into the primary sources of customer friction.

B. AI Insights Module

The AI Insights tab translates aggregate metrics into structured operational investigation directions:

- **Thematic Investigation Selector:** Users select an operational issue category (e.g., Billing & payment, Delivery) to focus analysis.
- **Thematic Summary Metrics:** Displays the exact count of negative reviews within the theme, the category's average priority score, and the highest individual priority score recorded.
- **Supporting Review Evidence:** Dynamically extracts and presents the three highest-priority customer review quotes within the selected category, providing instant qualitative evidence for the team.
- **Actionable Investigation Directions:** Presents specific, actionable operational auditing steps tailored to the issue category (e.g., reconciling disputed transactions, auditing courier carrier timelines, reproducing website error workflows).
- **Draft Response Copilot:** Provides a standardized, editable customer response template that support agents can personalize and verify before communicating with the customer.

C. Review Explorer Module

The Review Explorer enables exhaustive, review-level inspection to support human verification and auditing:

- **Multi-Dimensional Filtering:** Reactive multiselect filters allow users to slice data by sentiment (Positive, Neutral, Negative) and issue categories simultaneously.
- **Comprehensive Data Grid:** An interactive data table renders customer review text alongside predicted sentiment, model confidence, issue category, priority score, and optional metadata (star rating, branch location, submission date).
- **Enriched CSV Export:** A one-click export button generates an enriched CSV file ('revio_analyzed_reviews.csv') containing all model predictions, category labels, and priority scores for external spreadsheet or BI reporting.

D. Model Evaluation Module

Unlike black-box applications, Revio InsightOps AI features an in-app transparency tab dedicated to model governance:

- **Saved Benchmark Verification:** Directly parses and displays the held-out evaluation metrics stored in 'models/evaluation_metrics.json' from the Yelp benchmark split.
- **Held-Out Performance Metrics:** Reports overall evaluation rows (2,870 test examples), overall accuracy (81.85%), and macro F1-score (0.6951).
- **Class-Wise Performance Breakdown:** Renders a complete class-level table detailing Precision, Recall, F1-Score, and Support for Positive, Neutral, and Negative classes, alongside explicit cautionary notes regarding domain transferability.

9. AI and Machine Learning Opportunity

In artificial intelligence engineering, choosing the appropriate model complexity is a critical strategic decision. While modern Large Language Models (LLMs) and transformer architectures receive substantial public attention, they introduce heavy computational overhead, latency penalties, high inference costs, and potential hallucination risks. For a high-throughput customer review triage baseline, the combination of TF-IDF feature extraction and Logistic Regression represents an optimal engineering choice:

- **Sub-Millisecond Inference Latency:** Inference executes in sub-millisecond timeframes on standard CPU hardware, enabling the application to process 14,000+ customer reviews in seconds without specialized GPU infrastructure.
- **Direct Interpretability and Auditability:** Linear model coefficients directly map n-gram tokens to sentiment logits. Model behavior can be audited, understood, and debugged without opaque latent embeddings.
- **Zero Non-Deterministic Drift:** Logistic Regression training is convex and deterministic. Given identical data and hyperparameters, it produces identical, reproducible results without stochastic variance.
- **Zero API Cost and Data Privacy:** Because all inference runs locally within the Python environment, no sensitive customer comments or enterprise data are transmitted to external third-party API providers.

10. Potential Business Applications for Cynbit

Without making assumptions regarding Cynbit's internal proprietary workflows, technology stacks, or client portfolios, the architectural capabilities demonstrated in Revio InsightOps AI offer versatile, high-impact business applications across several standard enterprise operational environments:

Enterprise Scenario	Operational Challenge	Revio InsightOps AI Strategic Value
Customer Support & Helpdesk Triage	Support inboxes receive thousands of mixed inquiries, bug reports, and complaints, creating high ticket resolution latency.	Pre-sort incoming tickets by predicted negative sentiment and priority score >= 40, automatically routing high-risk complaints to senior support specialists.

Enterprise Scenario	Operational Challenge	Revio InsightOps AI Strategic Value
Product Quality & QA Monitoring	Product management teams struggle to aggregate qualitative feedback across diverse user reviews following major software or product releases.	Issue categorization immediately aggregates feedback tagged with 'App & website' or 'Product quality', surfacing localized release regressions within minutes.
Multi-Location & Franchise Operations	Multi-branch retail, hospitality, or service businesses lack a unified view of branch-level operational consistency.	Leveraging the optional 'branch' metadata attribute enables operations managers to isolate location-specific delivery delays or staff support complaints.
Executive Feedback & BI Reporting	Leadership requires periodic qualitative summaries to complement quantitative Net Promoter Scores (NPS) and CSAT surveys.	The system generates structured, exportable datasets that feed enterprise BI dashboards (Power BI / Tableau) with evidence-backed sentiment drivers.

11. Expected Operational Benefits

Deploying an evidence-backed customer feedback intelligence system delivers concrete operational benefits across four core metrics:

- **Dramatic Reduction in Triage Latency:** Analysts bypass thousands of routine reviews and navigate straight to the high-priority negative queue, compressing initial triage cycles from hours to minutes.
- **Taxonomy Standardization:** Eliminates analyst subjectivity by applying standardized, transparent heuristic rules across all customer feedback records.
- **Evidence-Grounded Accountability:** Decision makers are never forced to accept an abstract score on blind faith; supporting review quotes are attached directly to every recommendation for immediate validation.
- **Cross-Functional Data Interoperability:** Exportable CSV artifacts enable seamless hand-offs between customer support, engineering, logistics, and executive steering committees.

12. Evidence and Demonstrated Results

The technical and operational validity of Revio InsightOps AI has been validated through rigorous benchmarking on real-world customer review data. It is essential to distinguish between two distinct datasets and contexts evaluated in this project:

- **1. Observed Dashboard Ingestion Dataset (14,351 Records):** The live public Streamlit application was loaded and evaluated with a real Yelp customer review CSV containing 14,351 uploaded records.
- **2. Held-Out Evaluation Benchmark Split (2,870 Records):** A clean, deduplicated dataset of 14,350 usable Yelp records was partitioned into an 80/20 stratified split (11,480 training records; 2,870 held-out test records) to compute formal model performance metrics.

A. Observed Dashboard Results on 14,351 Uploaded Records

When processing the 14,351 Yelp customer review dataset in the live Streamlit dashboard, the system produced the following operational distribution:

Observed Dashboard Metric	Observed Value	Proportion of Volume	Operational Interpretation
Total Reviews Analysed	14,351	100.0%	Complete dataset successfully ingested and normalized without runtime failure
Negative Reviews	2,799	19.5%	Isolated customer grievance volume requiring operational inspection
Positive Sentiment	9,586	66.8%	Prevailing positive feedback volume reflecting baseline customer satisfaction
Neutral Sentiment	1,966	13.7%	Borderline and mixed sentiment feedback requiring careful contextual review
High-Priority Flags	76	0.53%	Critical reviews scoring >= 40 (urgent billing, fraud, or safety issues)
Low-Confidence Predictions	1,206	8.40%	Inference probability < 0.55; automatically flagged for human verification

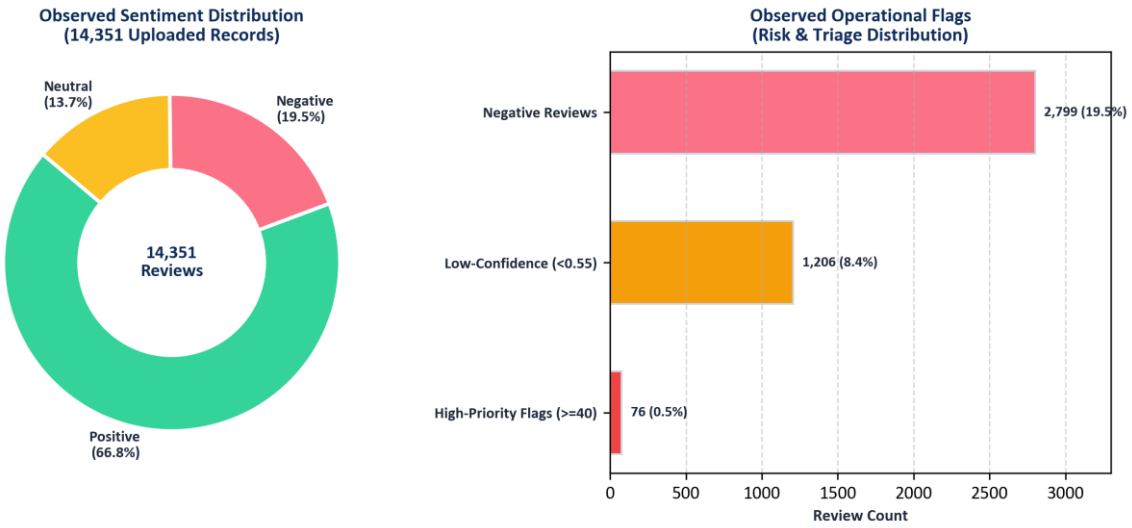

Figure 2: Observed sentiment distribution and operational risk flags across 14,351 uploaded Yelp records.

B. Held-Out Benchmark Performance on 2,870 Test Records

Formal model evaluation was conducted on 2,870 held-out test examples from the curated Yelp dataset. The model achieved an overall accuracy of 81.85% and a macro F1-score of 0.6951 across the three sentiment classes.

Sentiment Class	Precision	Recall	F1-Score	Test Support	Key Evaluation Finding
Positive	0.913	0.899	0.906	1,971	High precision and recall; distinct, abundant positive vocabulary
Negative	0.766	0.806	0.785	540	Strong recall capturing 80.6% of customer complaints; critical for risk triage
Neutral	0.392	0.396	0.394	359	Weaker performance due to mixed sentiment in 3-star reviews and limited support
Overall / Macro Avg	0.691	0.700	0.695	2,870	Macro F1 reflects unweighted class balance across all three classes
Overall Accuracy	—	—	81.85%	2,870	81.85% overall accuracy on the held-out Yelp test split

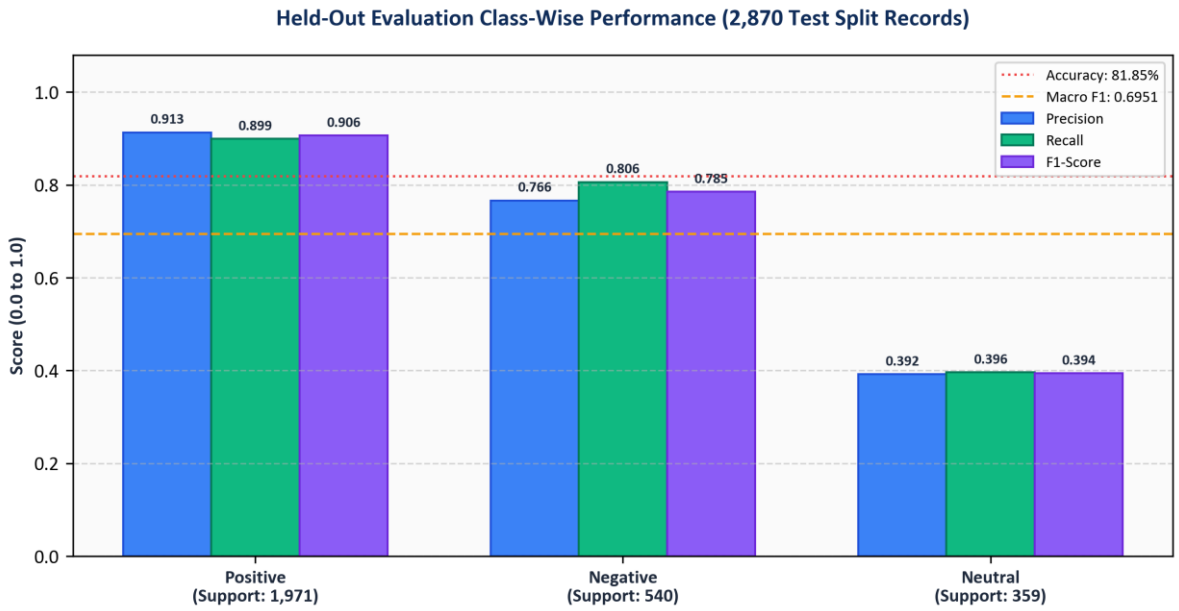

Figure 3: Class-wise Precision, Recall, and F1 performance on the 2,870 held-out test split records.

13. Proposed Pilot and Success Metrics for Cynbit

To evaluate Revio InsightOps AI in an operational environment without risk, we propose a structured, four-phase 6-week controlled pilot framework. Rather than assuming hypothetical productivity percentages or financial savings, this pilot is designed to systematically measure performance deltas against human baselines.

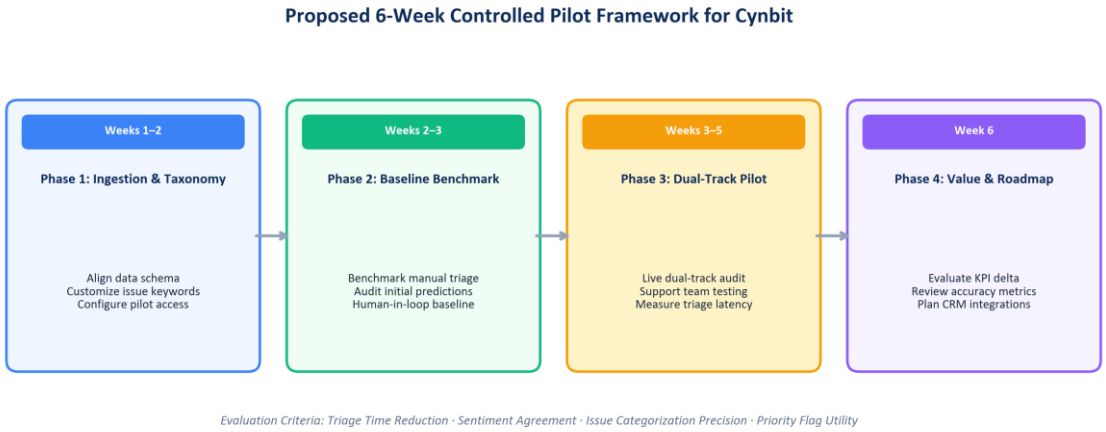

Figure 4: Proposed 6-week phased pilot roadmap for operational validation at Cynbit.

Pilot Phase	Duration	Key Workstreams & Objectives	Deliverables & Governance Gate

Pilot Phase	Duration	Key Workstreams & Objectives	Deliverables & Governance Gate
Phase 1: Ingestion & Taxonomy Alignment	Weeks 1–2	Align CSV schemas, evaluate domain-specific terminology, and calibrate issue categorization keyword dictionaries to match Cynbit's business domain.	Curated pilot taxonomy; initial baseline ingestion check; data privacy sign-off.
Phase 2: Baseline Benchmarking	Weeks 2–3	Measure current manual review triage time on a sampled batch of customer reviews (e.g., 500 reviews). Have domain analysts independently label sentiment and issues.	Documented human triage speed baseline; human ground-truth benchmark dataset.
Phase 3: Dual-Track Operational Trial	Weeks 3–5	Run Revio InsightOps AI in parallel with manual workflows. Support analysts utilize AI Insights and priority flags to guide triage.	Weekly operational logs; recorded triage time deltas; analyst qualitative feedback.
Phase 4: Value Assessment & Roadmap	Week 6	Compare AI-assisted triage speed and agreement rates against Phase 2 baselines. Review utility of high-priority flags and outline production integrations.	Final Pilot Performance Report; ROI feasibility assessment; CRM integration architecture.

Key Measurable Pilot Success Criteria:

- **Triage Time-to-Insight Reduction:** Measure the exact reduction in hours required to triage a fixed batch of 1,000 customer reviews using Revio InsightOps AI compared to the manual baseline.
- **Sentiment Classification Agreement:** Measure the percentage agreement between model predictions and human analyst labels on domain-specific feedback (target >= 82% agreement).
- **Issue Categorization Precision:** Measure Precision and Recall of the rule engine across domain-specific categories following dictionary tuning (target >= 85% precision).
- **High-Priority Flag Actionability:** Measure the percentage of reviews flagged with priority score >= 40 that genuinely required immediate managerial intervention (target >= 90% actionable utility).
- **User Satisfaction & Trust:** Collect qualitative usability feedback from analysts regarding workflow ergonomics, response template utility, and dashboard responsiveness.

14. Limitations and Risks

A senior engineering approach requires candid transparency regarding technical boundaries and known constraints. Revio InsightOps AI operates under the following documented engineering limitations:

- **1. Neutral Class Classification Weakness:** In benchmark evaluations, the neutral sentiment class achieved an F1-score of 0.394 (Precision 0.392, Recall 0.396). Three-star reviews in the Yelp dataset frequently exhibit mixed sentiment ('great food but awful wait times'), which linear bag-of-words models struggle to disentangle. Neutral predictions must be treated with caution.

- **2. Domain-Specific Transferability:** The sentiment pipeline was trained exclusively on restaurant reviews. While core polarity words ('excellent', 'terrible', 'defective') generalize well, domain-specific vocabulary in specialized B2B software, fintech, or manufacturing may require domain retraining.
- **3. Rule-Based Categorization Rigidity:** The issue categorization engine relies upon deterministic keyword dictionaries. It does not generalize to novel slang, unlisted synonyms, or misspelled keywords, defaulting unmatched feedback to 'Other'.
- **4. Heuristic Priority Scoring:** The priority score is a heuristic ranking mechanism bounded between 1 and 55. It reflects textual urgency cues and negative sentiment, but does not represent a statistical probability of customer churn or financial loss.
- **5. Uncalibrated Model Confidence:** Logistic Regression probability outputs have not undergone Platt scaling or isotonic calibration. Probabilities reflect internal decision margins rather than true Bayesian likelihoods.
- **6. Non-Autonomous Operation:** The prototype provides decision support only. It does not autonomously contact customers, issue refunds, or modify backend database records without explicit human intervention.

15. Future Opportunities

While the current prototype delivers a robust baseline, several high-value technical and architectural enhancements can be pursued in subsequent iterations:

- **1. Transformer Architecture Upgrade:** Fine-tune a lightweight transformer model (such as ModernBERT or RoBERTa) on domain-specific feedback to resolve linguistic nuance, sarcasm, and mixed sentiment in neutral reviews.
- **2. Unsupervised Issue Discovery:** Implement unsupervised semantic topic modeling (using BERTopic or HDBSCAN) to discover emerging customer complaint themes dynamically without manual keyword dictionary maintenance.
- **3. Context-Aware LLM Response Drafting:** Integrate an enterprise LLM (e.g., Gemini or Claude) with retrieval-augmented grounding (RAG) to generate highly personalized, context-aware customer response drafts subject to human approval.
- **4. Temporal Trend & Anomaly Detection:** Ingest timestamped reviews to calculate historical issue velocity, alerting management to emerging operational defects before they escalate into systemic failures.
- **5. Enterprise CRM & Ticketing Connectors:** Develop bidirectional REST connectors to push high-priority reviews directly into Zendesk, Jira Service Management, or Salesforce CRM as prioritized support tickets.

16. Conclusion

Revio InsightOps AI demonstrates a disciplined, production-minded approach to applied artificial intelligence. Rather than over-engineering a complex, opaque solution with high operational overhead, the system leverages a pragmatic combination of classical machine learning and transparent heuristic rules to solve an acute business problem: turning overwhelming volumes of qualitative customer feedback into prioritized, evidence-backed operational actions.

By delivering sub-millisecond CPU inference, full data privacy, an intuitive Streamlit interface, and comprehensive auditability, Revio InsightOps AI establishes a dependable foundation for enterprise customer intelligence. When evaluated through a controlled pilot, this system offers Cynbit a low-risk,

high-impact framework to accelerate triage speed, standardize operational feedback taxonomies, and enhance customer retention.

17. Dataset Source and Access

Transparency and reproducibility are fundamental to rigorous AI engineering. The dataset utilized for model training and evaluation is documented below:

- **Dataset Name:** Yelp Restaurant Reviews Sentiment Dataset (rating_review polarity labels).
- **Curated Usable Records:** 14,350 deduplicated, non-empty text records with verified 3-class ground truth labels (Positive: 9,857; Negative: 2,698; Neutral: 1,795).
- **Zenodo Dataset Source:** https://zenodo.org/records/18723813 (Publicly accessible repository record).

Zenodo Digital Object Identifier (DOI): https://zenodo.org/records/18723813

Google Drive Dataset Repository Access

For internal testing and verification, the prepared training and evaluation CSV files are mirrored on Google Drive. Please use the verified access link below:

Google Drive Dataset Link: real_yelp_reviews.csv - Google Drive

18. Project Verification Links

All aspects of Revio InsightOps AI—including live application hosting, source code version control, model artifacts, and benchmark evaluations—are openly accessible for review:

Project Resource	Direct Clickable Hyperlink	Verification Purpose
Live Interactive Application	https://revio-insightops-ai.streamlit.app/	Live public Streamlit application for end-to-end user testing
GitHub Source Repository	https://github.com/Bhishant/revio-insightops-ai	Complete project codebase, training scripts, tests, and documentation
Zenodo Benchmark Dataset	https://zenodo.org/records/18723813	Open-access repository for Yelp restaurant review sentiment data
Google Drive Dataset Share	real_yelp_reviews.csv - Google Drive	Curated mirror repository for raw CSV files (replace placeholder)

- **Live Streamlit Application:** https://revio-insightops-ai.streamlit.app/
- **GitHub Source Repository:** https://github.com/Bhishant/revio-insightops-ai
